Supplementary Figure 2. Case 2. A 28-year-old man diagnosed with coronavirus disease 2019 pneumonia without secondary infection. (A) Initial chest radiography obtained on the 1st hospital day shows the ill-defined increased opacity in the left upper lung zone. (B) Initial low dose chest axial computed tomography scan obtained on the 1st hospital day shows peribronchial ill-defined consolidation with peripheral ground glass opacities in the left upper lobe.
