Supplementary Figure 4. Case 4. A 36-year-old man diagnosed with coronavirus disease 2019 pneumonia without secondary infection. (A) Initial chest radiography obtained on the 1st hospital day shows the ill-defined increased opacity in the right lower lung zone (arrow). (B) Initial low dose chest axial computed tomography scan obtained on the 2nd hospital day shows multiple centrilobular nodules with peripheral ground glass opacities in the right lower lobe.
